

Introduction to Topology

General Topology, Lecture 15

Haoming Wang

27 July 2019

THIS IS THE LECTURE NOTE FOR THE *Introduction to Topology*. The course covers the following topics: Naive Set Theory, Elementary Number Theory, Group Theory, Topological Spaces and Continuous Maps, Introduction to Algebraic Topology.

CONTENT:

1. [Compactness](#)
2. [Bound](#)

Compactness

Definition 1 (Compact). Let X be a top. sp. we say that X is compact if $\forall U_\alpha \subseteq_{\text{open}} X (\alpha \in A), X = \bigcup_{\alpha \in A} U_\alpha \Rightarrow \exists \alpha_1, \dots, \alpha_k \in A$, s.t. $X = U_{\alpha_1} \cup \dots \cup U_{\alpha_k}$.

Definition 2 (Compact Subset). Let X be a top. sp. $K \subseteq X$, we say K is a compact subset in X , if $\forall U_\alpha \subseteq_{\text{open}} X (\alpha \in A), K \subseteq \bigcup_{\alpha \in A} U_\alpha \Rightarrow \exists \alpha_1, \dots, \alpha_k \in A$, s.t. $K \subseteq U_{\alpha_1} \cup \dots \cup U_{\alpha_k}$.

Exercise 1. Show that K is a compact subset in $X \Leftrightarrow K$ (equipped with the subspace topology) is a compact space.

Proof. \Rightarrow : For any $V_\alpha \subseteq_{\text{open}} K, \exists U_\alpha \subseteq_{\text{open}} X$, s.t. $V_\alpha = U_\alpha \cap K$. For any

$$\begin{aligned} K &= \bigcup_{\alpha \in A} V_\alpha \\ &= \bigcup_{\alpha \in A} U_\alpha \cap K \\ &= K \cap \bigcup_{\alpha \in A} U_\alpha \\ &= K \cap (U_{\alpha_1} \cup \dots \cup U_{\alpha_k}) \\ &= V_{\alpha_1} \cup \dots \cup V_{\alpha_k} \end{aligned}$$

Thus K is compact. \Leftarrow : for any $K \subseteq \bigcup_{\alpha \in A} U_\alpha$, we have $\bigcup_{\alpha \in A} (U_\alpha \cap K) \subseteq K$ and

$$\begin{aligned} K &= K \cap K \\ &\subseteq K \cap \bigcup_{\alpha \in A} U_\alpha \\ &= \bigcup_{\alpha \in A} (K \cap U_\alpha) \end{aligned}$$

Thus $K = \bigcup_{\alpha \in A} (K \cap U_\alpha) = \bigcup_{\alpha \in A} V_\alpha$, where $V_\alpha \subseteq_{\text{open}} K$. And $\exists V_{\alpha_1}, \dots, V_{\alpha_k} \subseteq_{\text{open}} K$, s.t.

$$\begin{aligned} K &= V_{\alpha_1} \cup \dots \cup V_{\alpha_k} \\ &= K \cap (U_{\alpha_1} \cup \dots \cup U_{\alpha_k}) \\ &\subseteq U_{\alpha_1} \cup \dots \cup U_{\alpha_k} \end{aligned}$$

Thus K is a compact subset in X . □

Definition 3 (Hausdorff Topology Space). A top. sp. X is Hausdorff if $\forall p, q \in X, p \neq q \Rightarrow \exists$ open nbds U of p and V of q in X such that $U \cap V = \emptyset$.

Example 1. Let $X = \{1, 2\}$, \mathcal{T} is trivial topology, then (X, \mathcal{T}) is not a Hausdorff topology space.

Note 1. Thus the larger top. is, the more likely it is to be Hausdorff.

Proposition 1. Suppose X is Hausdorff, $K(\subseteq X)$ is compact, $p \in X \setminus K \Rightarrow \exists U, V \subseteq_{\text{open}} X$, s.t. $K \subseteq V, p \in U$, and $U \cap V = \emptyset$.

Proof. X is Hausdorff $\Rightarrow \forall q \in K, \exists U_q, V_q \subseteq_{\text{open}} X$ s.t. $q \in V_q, p \in U_q, U_q \cap V_q = \emptyset$. Thus $K \subseteq \bigcup_{q \in K} V_q = \bigcup_{i=1}^k V_{q_i}$. Let $V = \bigcup_{i=1}^k V_{q_i}, U = \bigcap_{i=1}^k U_{q_i}$, then

$$\begin{aligned} U \cap V &= \left(\bigcap_{j=1}^k U_{q_j} \right) \cap \left(\bigcup_{i=1}^k V_{q_i} \right) \\ &= \bigcup_{i=1}^k \left[\bigcap_{j=1}^k (U_{q_j} \cap V_{q_i}) \right] \\ &= \bigcup_{i=1}^k \emptyset = \emptyset. \end{aligned}$$

□

Corollary 1. Suppose X is Hausdorff, $K \subseteq_{\text{cpt.}} X$ is compact $\Rightarrow K$ is closed.

Proof. For $\forall p \in X \setminus K, \exists W_p \subseteq_{\text{open}} X$, s.t. $p \in W_p$ and $W_p \cap K = \emptyset$, that is $W_p \subseteq X \setminus K$. And because

$$X \setminus K = \bigcup_{p \in X \setminus K} \{p\} \subseteq \bigcup_{p \in X \setminus K} W_p \subseteq X \setminus K$$

we have that $X \setminus K = \bigcup_{p \in X \setminus K} W_p \subseteq_{\text{open}} X$, and then $K \subseteq_{\text{close}} X$. □

Exercise 2. Suppose X is locally compact Hausdorff, $K \subseteq_{\text{cpt.}} X$, $C \subseteq_{\text{close}} X$, show that if $C \cap K = \emptyset \Rightarrow \exists U, V \subseteq_{\text{open}} X$, s.t. $K \subseteq V, C \subseteq U$ and $U \cap V = \emptyset$.

Proposition 2. Suppose X is a compact space, $K \subseteq_{\text{close}} X \Rightarrow K \subseteq_{\text{cpt.}} X$.

Note 2. If X is Haus. $K \subseteq_{\text{cpt.}} X$ is close;
If X is cpt. $K \subseteq_{\text{close}} X$ is cpt.

Proof. Suppose that $U_\alpha \subseteq_{\text{open}} X (\alpha \in A)$ cover K , i.e. $K \subseteq \bigcup_{\alpha \in A} U_\alpha$. Then

$$\begin{aligned} X &= K \cup (X \setminus K) \subseteq \\ &(\bigcup_{\alpha \in A} U_\alpha) \cup (X \setminus K) \\ &= \left[\bigcup_{i=1}^k U_{\alpha_i} \right] \cup (X \setminus K) \\ &= \bigcup_{i=1}^k [U_{\alpha_i} \cup (X \setminus K)] \end{aligned}$$

and

$$\begin{aligned} K &= K \cap X = K \cap \left[\bigcup_{i=1}^k U_{\alpha_i} \cup (X \setminus K) \right] \\ &= \bigcup_{i=1}^k [K \cap ((X \setminus K) \cup U_{\alpha_i})] \\ &= \bigcup_{i=1}^k [(K \cap (X \setminus K)) \cup (K \cap U_{\alpha_i})] \\ &= \bigcup_{i=1}^k (K \cap U_{\alpha_i}) \\ &\subseteq \bigcup_{i=1}^k U_{\alpha_i}. \end{aligned}$$

Note 3. So the standard routines for proving a set K is cpt. is suppose $U_\alpha (\alpha \in A)$ cover it at first, and then try to argue $K \subseteq \bigcup_{i=1}^k U_{\alpha_i}$.

Thus K is compact. □

Exercise 3. X is locally compact Hausdorff (LCH) space, $C \subseteq_{\text{close}} X$, show that $\forall c \in C, \exists T_c \subseteq_{\text{cpt.}} C$, s.t. $c \in T_c$.

Proof. For $\forall c \in C, \exists S_c \subseteq_{\text{cpt.}} X$, s.t. $c \in S_c$ and $c \in S_c \cap C$. Since $S_c \subseteq_{\text{cpt.}} X \Rightarrow S_c \subseteq_{\text{close}} X \Rightarrow S_c \cap C \subseteq_{\text{close}} X$

$$\begin{aligned} X \setminus (S_c \cap C) &\subseteq_{\text{open}} X \\ \Rightarrow S_c \cap (X \setminus (S_c \cap C)) &\subseteq_{\text{open}} S_c \\ \Rightarrow S_c \setminus [S_c \cap (X \setminus (S_c \cap C))] &\subseteq_{\text{close}} S_c \\ \Rightarrow (S_c \setminus S_c) \cup [S_c \setminus X \setminus (S_c \cap C)] &\subseteq_{\text{close}} S_c \\ \Rightarrow S_c \setminus X \setminus (S_c \cap C) & \\ = S_c \cap C &\subseteq_{\text{close}} S_c. \end{aligned}$$

Note 4. $A \subseteq_{\text{close}} X, A \subseteq B \subseteq X$, then $A \subseteq_{\text{close}} B$.

Since $S_c \cap C \subseteq_{\text{close}} S_c, S_c$ is cpt. $\Rightarrow S_c \cap C \subseteq_{\text{cpt.}} S_c \Rightarrow S_c \cap C$ is cpt. $\Rightarrow S_c \cap C \subseteq_{\text{cpt.}} C$. □

Note 5. Remember that $A \subseteq_{\text{cpt.}} B$ means A is a cpt. subset of B , which is equivalent with A is a cpt. set.

Proposition 3. X, Y are cpt. space $\Rightarrow X \times Y$ (equipped with the product topology) is compact.

Proof. Trivial. Fix x , consider $\{x\} \times Y$. then utilize the definition of product topology, and then use the compactness of Y . Thus $\{x\} \times Y$ could be covered by finite open set. For detailed argument, see [here](#)(0:52:00). □

Proposition 4. Suppose X, Y are top. sp. $X \xrightarrow{f} Y$ is continuous. $K \subseteq_{\text{cpt.}} X \Rightarrow f(K) \subseteq_{\text{cpt.}} Y$.

Proof. Suppose $V_\alpha (\alpha \in A)$ cover $f(K)$, that is $f(K) \subseteq \cup_{\alpha \in A} U_\alpha$, thus

$$\begin{aligned} K &\subseteq f^{-1}(\cup_{\alpha \in A} U_\alpha) \\ &= \cup_{\alpha \in A} f^{-1}(U_\alpha) \\ &= \cup_{i=1}^k f^{-1}(U_{\alpha_i}) \\ &= f^{-1}(\cup_{i=1}^k U_{\alpha_i}). \end{aligned}$$

Note 6. Since f is continuous, $f^{-1}(U_\alpha) (\alpha \in A)$ are open.

Thus $f(K) \subseteq \cup_{i=1}^k U_{\alpha_i}$ and it is compact. □

Corollary 2. Suppose map $X \xrightarrow{f} Y$ is conti. X is compact, Y is Hausdorff, then f is a closed map, i.e. $C \subseteq_{\text{close}} X \Rightarrow f(C) \subseteq_{\text{close}} Y$.

Proof. $C \subseteq_{\text{close}} X, X$ is compact $\Rightarrow C \subseteq_{\text{cpt.}} X \Rightarrow f(C) \subseteq_{\text{cpt.}} Y, Y$ is Hausdorff $\Rightarrow f(C)$ is close. □

Corollary 3. Suppose map $X \xrightarrow{f} Y$ is conti. bijection, X is compact, Y is Hausdorff $\Rightarrow f$ is a homeomorphism.

Proof. f is closed map, and f is a bijection, thus f^{-1} is continuous. f is bijection, f and f^{-1} are continuous, thus f is a homeomorphism. \square

Bound

Definition 4 (Upper Bound). Given $A \subseteq \mathbb{R}$, we call $u \in \mathbb{R}$ is a upper bound of A if $a \leq u$ for $\forall a \in A$; $l \in \mathbb{R}$ is a lower bound of A if $l \leq a$ for $\forall a \in A$.

Definition 5 (Greatest Element). $x \in \mathbb{R}$ is the greatest (smallest) element of A if $x \in A$ and x is a upper (lower) bound of A .

Definition 6 (Least Upper Bound). $u \in \mathbb{R}$ is the least upper bound (or supremum) of A , if u is the smallest element of the set of all upper bounds of A , denote as $u = \sup A$.

$l \in \mathbb{R}$ is the greatest lower bound (or infimum) of A , if l is the greatest element of the set of all lower bounds of A , denote as $l = \inf A$.

Example 2. Let $A = [0, 1)$, the set of upper bound of A is $[1, \infty)$, the set of lower bound of A is $(-\infty, 0]$. Thus $\sup A = 1, \inf A = 0$.

Suppose we admit that the gapless property of real number: if $\emptyset \neq S \subseteq \mathbb{R}$ has upper bound (lower bound), then $\sup S (\inf S) \in S$.

Theorem 1. $[0, 1]$ (as a subspace of \mathbb{R}) is compact.

Proof. Suppose that $V_\alpha \subseteq_{open} \mathbb{R} (\alpha \in A)$ cover $[0, 1]$. Consider

$$S := \{s \in [0, 1] \mid [0, s] \text{ can be covered by finitely many } V_\alpha\}$$

Thus $0 \in S, S \neq \emptyset. S \subseteq [0, 1]$, thus S has an upper bound $\Rightarrow \sup S \in S$. Let $s_0 := \sup S$. Since 1 is an upper bound of $S, s_0 \leq 1$. For $\forall t \leq s_0, t$ is not an upper bound of $S, \exists s' \in S, \text{ s.t. } t < s', \text{ thus } [0, t] \text{ could be covered by finitely many } V_\alpha$.

Since $s_0 \leq 1, \exists \alpha_0, \text{ s.t. } s_0 \in V_{\alpha_0}, \exists r > 0, \text{ s.t. } B_r(s_0) \subseteq V_{\alpha_0}$. Thus $[0, s_0 - r]$ can be covered by finitely many of V_α , and $(s_0 - r, s_0 + r)$ can be covered by V_{α_0} . Thus $[0, s_0 + r)$ can be covered by finitely many V_α . Thus $s_0 = 1$ and $s_0 \in S \Rightarrow S = [0, 1]$. \square

Thus $[0, 1] \times [0, 1]$, as a subspace of \mathbb{R}^2 , which coincides with the product space of $[0, 1]$ and $[0, 1]$, is compact.

More generally, we can reprove the **Heine–Borel theorem**: for $K \subseteq \mathbb{R}^n$, then $K \subseteq_{cpt} \mathbb{R}^n \Leftrightarrow K \subseteq_{close} \mathbb{R}^n$ and K is bdd.

Proof. $\Rightarrow: \mathbb{R}^n$ is metric space $\Rightarrow \mathbb{R}^n$ is Hausdorff $\Rightarrow K \subseteq_{close} \mathbb{R}^n$. Since $K \subseteq \bigcup_{n \in \mathbb{N}} B_n(0) \Rightarrow \exists r_1, \dots, r_k, \text{ s.t. } K \subseteq \bigcup_{i=1}^k B_{r_i}(0) \Rightarrow K \text{ is bdd.}$

Note 7. Actually, In any metric space X , $K \subseteq_{cpt} X \Rightarrow K \subseteq_{close} X$ and be bdd.

\Leftarrow : K is bdd. $\Rightarrow, \exists r > 0$, s.t. $K \subseteq B_r(0), \Rightarrow \exists [a_1, b_1], \dots, [a_n, b_n] \in \mathbb{R}$, s.t. $K \subseteq B_r(0) \subseteq \times_{i=1}^n [a_i, b_i]$. Since $K \subseteq_{close} \mathbb{R}^n \Rightarrow K \subseteq_{close} \times_{i=1}^n [a_i, b_i] \subseteq_{cpt.} \mathbb{R}^n \Rightarrow K \subseteq_{cpt.} \times_{i=1}^n [a_i, b_i] \Rightarrow K$ is cpt. \square

Exercise 4. Suppose $S \subseteq_{close} \mathbb{R}$ and $S \neq \emptyset$, S has an upper bound, show that $\sup S \in S$.

Proof. Let $s_0 := \sup S$. If $s_0 \notin S \Rightarrow s_0 \in \mathbb{R} \setminus S \subseteq_{open} \mathbb{R}$. Thus $\exists r > 0$, s.t. $B_r(s_0) \in \mathbb{R} \setminus S$, that is $s_0 - r \in \mathbb{R} \setminus S \Rightarrow s_0 - r \geq s (\forall s \in S)$. But s_0 is the smallest upper bound, then $\forall s' < s_0, \exists s \in S$, s.t. $s > s'$, which leads to a contradiction. \square

Corollary 4. Given a conti. map $K \xrightarrow{f} \mathbb{R}$, K is cpt. $\Rightarrow f$ has a max. and min.

Proof. K is cpt., f is conti. $\Rightarrow f(K) \subseteq_{cpt.} \mathbb{R} \Rightarrow f(K) \subseteq_{close} \mathbb{R}$ and be bdd. Thus $f(K)$ has a upper bound and lower bound, thus $\max f(K) = \sup f(K) \in f(K)$ and $\min f(K) = \inf f(K) \in f(K)$. \square
